ABOUT ME

I'm a hard worker and spend most of my free time building software, whether it's a full project that ends up on GitHub or something I pick apart for a day or two just to see how it works. I like helping people, I'm easy to talk to, and I enjoy working through problems with others and talking about what I'm building.

WORK EXPERIENCE

General Contractor, ADR LLC — June 2024 - Present

- Built the company's app and handled their tech.
- Worked on-site in the field alongside the crew.

Other

- Built websites for clients, and reviewed and audited existing sites for business owners to find problems and make them run more efficiently.
- Upgraded and scaled existing server setups for clients with zero downtime.

PROJECTS

Drone Tracker — YOLOv8, CoreML

- Real-time system that lets a drone spot and track objects from the air through its camera. My most noticed project so far; people have emailed me about it.
- Fine-tuned a YOLOv8 vision model and got it running in real time on Apple's Neural Engine, then connected it to the flight controller over ArduPilot/MAVLink.

Car ECU Tool (OBD-II) — C++

- Built a tool that plugs into a car's OBD-II port and talks directly to the engine computer.
- Worked out the seed/key security unlock, then added reading and dumping ECU firmware, flashing, and vehicle control functions.

ROS 2 Rebuilt in Rust — Rust

- Rebuilt ROS 2, the Robot Operating System used across the robotics industry, from the ground up in Rust.

picommand — FastAPI, PostgreSQL, Redis

- System for managing a fleet of Raspberry Pis spread across multiple networks from one dashboard.
- The hard part was getting Pis on different networks to talk to each other securely without opening any ports on any of the networks.

Games and Other Projects

- Made multiple video games, from design to finished build.
- **Pip**: coding habit tracker built as a digital pet (React and SwiftUI).
- Networking tools, including reverse proxies, built from scratch.
- Run my own test and production servers at home, where I test everything I build before it goes live.

SKILLS

Languages: Python (strongest), C#, HTML/CSS/JavaScript (full stack), C++, Rust, Swift, SQL (MariaDB, PostgreSQL), Go (basic)

Networking: Strong understanding of every layer of networking, VLANs, reverse proxies, secure connections between networks

Security: Reverse engineering, cybersecurity beyond the basics, website and server auditing

Workflow: Git and GitHub version control on multiple full projects, test/prod environments, testing and debugging my own code

People: Explaining technical things in plain language, helping people with tech, teamwork

EDUCATION

L'Anse Creuse High School North, Expected graduation 2028 — Chesterfield, MI

- Honors cord in Programming and Game Design.
- Regular community volunteer.
